# JF Aesthetics platform rebuild

**Base** Laravel 8 Hospital Management System
**Repositioned as** JF Aesthetics, Karachi
**Prepared** 21 Aug 2026

---

Everything shipped in this engagement so far: turning a stock Laravel hospital template into JF Aesthetics' clinic system — fixing a recurring class of schema-mismatch bugs, completing three features that were built but never wired up, adding invoice generation from scratch, and redesigning the admin dashboard.

| 14 | 13 | 1 | 30+ |
|---|---|---|---|
| Schema / logic bugs fixed | New migrations written | New module — Invoicing | Routes verified live |

01 — IDENTITY

## Rebrand to JF Aesthetics

Name, phone, and address now flow from one settings source instead of being scattered across hardcoded strings.

**Site identity** Updated

`APP_NAME` set to **JF Aesthetics** — this alone re-labels every page title, the admin header, the login screen, and the footer credit, since they all read from it already.

**Settings key mismatch** Bug

The public site's phone and email never actually reflected what the admin `Settings` panel saved — the template read `phone` / `email`, while the form actually wrote `business_phone` / `business_email`.

Every edit an admin made was silently discarded.

Realigned the keys in `layouts/app.blade.php`. Settings changes now take effect immediately. Values set: **03327841753**, Defence Phase 5, Near Medicare Clinic, Karachi.

### Logo & icon Replaced

The old logo/icon files were static leftovers from the original theme — literally the words "Life Care" baked into a PNG, disconnected from any setting.

Generated a new mark with PHP GD (teal roundel + wordmark, "JF" monogram favicon) and replaced both the live `storage/app/public` files and the static fallback images, so no old branding remains anywhere in the theme.

### Homepage copy Updated

Hero typewriter line rewritten from "Welcome to Life Care / We Care Your Health" to **"Welcome to JF Aesthetics / We Care Your Beauty."**

02 — ROOT CAUSE

## Sitewide broken images

Every uploaded image on the site — logos, patient photos, employee photos — was 404ing. One missing command, found and fixed.

### Storage symlink never created Root cause

`public/storage` is supposed to be a symlink into `storage/app/public`. It had never been created on this install, so every `.../storage/...` image reference across the entire site resolved to nothing.

Ran `php artisan storage:link`. This alone fixed logos, patient/doctor photos, and any future admin file uploads.

### Dead attribute crash on the homepage Bug

Four places in `index.blade.php` read `$app->icon_logo_path` — an attribute that doesn't exist on any model. It only "worked" before because `$app` is a Laravel-reserved variable name (the framework auto-shares the container as `$app` in every view) that the original code happened to shadow with a Settings row. Removing that shadow assignment made the container itself resolve, and the page hard-crashed.

Replaced all four occurrences with a clean local `$iconValue` pulled from the Settings model.

03 — PUBLIC SITE

## Booking form & doctor dropdown

The homepage's "Book Appointment" form is the client's most visible complaint — it silently failed on every submission.

### Appointment request failed on every submit Bug

The form saved to a `doctor` property that didn't match the actual database column, `doctor_id` — which is required with no default. Every submission threw a SQL error instead of saving.

Renamed the property to `doctor_id` throughout `Appointmentform.php`. Verified directly: a request now inserts cleanly.

### Doctor dropdown showed blank entries Bug

The option list read `$doctor->name` — an attribute that doesn't exist on the doctor model (only `employee_id` does). Every option rendered with no visible label.

Switched to `$doctor->employ->name` via the existing relation, and added a "Choose Doctor" placeholder. Confirmed real names now render, e.g. *Hortense Zulauf*.

04 — ADMIN PANEL

## The schema-mismatch sweep

A recurring bug class throughout this codebase: a Livewire component quietly writing to a property name that doesn't match its real database column. Once the pattern was recognized, a full audit surfaced it repeatedly.

### Nurses Completed

A full CRUD screen already existed — form, validation, photo upload, table — but its database table and Eloquent model had simply never been created. Every visit would have fatally errored.

Created the `nurses` migration and model, restored the sidebar link that had been commented out.

### Admin Appointments Bug

Trailing spaces in array keys ( `'intime '` , `'outtime '` ) silently dropped both times on every save. `nurse_id` had no column at all. `description` is required with no default, but was never collected —

every save threw a DB error. The doctor dropdown had the same blank-label bug as the public form.

Fixed the typos, added the `nurse_id` column and relation, added a description field, fixed the dropdown, restored the sidebar link.

### Operation Reports Bug

A copy-paste error wrote the doctor's ID into the `status` column instead of the actual status value.

One-line fix: `'status' => $this->doctor` → `$this->status`.

### Requested Appointments (admin edit) Bug

Edit/update referenced columns that don't exist on this table at all (`patient_id`, `intime`, `outtime`) instead of the real ones. The edit view didn't exist, and there was no Edit button anywhere in the UI — the feature was entirely unreachable.

Rewrote edit/update against the real columns, built the missing view, wired up a working Edit button.

### Medicine Store (inventory) Gap

Tracked price, quantity, and an opaque code — but no name. There was no way to tell what any row actually was.

Added a `name` column end-to-end (migration, model, form, table), and cleaned up malformed leftover markup on the input fields.

### Silent foreign-key typos Bug

`departments.hod_id`, `departments.block_id`, and `hods.doctor_id` all used a typo'd Blueprint method (`constrand()` / `constraned()`) — Laravel accepted it as a harmless no-op instead of erroring, so no foreign key constraint was ever actually created.

Verified no orphaned rows existed, then added the real constraints via a new migration.

### User role column Bug

The User model's fillable list included `role`; the actual column is `role_id`.

Corrected the fillable list.

# Invoice generation

Built from nothing, against a reference invoice the client supplied: line items with per-item discount (flat or percentage), a running payment history, and a printable A4 page.

### Data model

Three new tables — `invoices`, `invoice_items`, `invoice_payments` — support a patient with multiple service line items and multiple payments recorded over time, rather than the single flat amount the old `bills` table allowed.

### Admin flow

Pick a patient, add line items (service, quantity, service charge, discount), add payment entries (date, amount, mode) — Grand Total, Paid, and Unpaid recompute live as you type.

### Percentage discount

Each line item's discount can be entered as a flat `pkr` amount or a `%` — the percentage is computed against that line's subtotal automatically and shown on the invoice, e.g. *pkr 4,000 (10%)*.

### A4 printable invoice

A dedicated print page matches the client's reference layout: clinic branding, patient name and MR#, invoice ID / date / printed-by, the item table with discount, the payment history table, and a totals summary — opens in a new tab with a print / save-as-PDF control.

Checked against the reference sample: computed Grand Total / Paid / Unpaid matched exactly — **40,000 / 20,000 / 20,000**.

06 — ADMIN DASHBOARD

# Dashboard redesign

The client shared a dashboard from an unrelated retail/inventory system as a style reference. Rather than bolting on Product/Purchase/Sale modules that don't belong in a clinic system, the brief was clarified to: match the look, keep the real data.

### What it shows now

Period-filterable summary cards (Today / Last 7 Days / This Month / This Year) for Revenue, Outstanding, New Patients, and Appointment Requests; a 7-month Cash Flow chart; a current-month Collected-vs-Outstanding donut; a 12-month Yearly Report; tabbed Recent Transactions with status badges; and Top Services tables — the clinic-relevant read of "best sellers."

### Chart.js load-order bug Bug

The theme's bundled Chart.js (v2.9.4) was included at the very bottom of the page — after the dashboard's own chart-drawing scripts had already tried and failed to run, leaving every chart blank with no visible error.

Moved the include into `<head>` so the library is ready before any chart initializes.

07 — VERIFICATION

## How it was actually tested

Every fix in this report was checked against a running instance of the app, not just read for correctness.

| METHOD | WHAT IT COVERED |
|---|---|
| **Authenticated route sweep** | Logged in via a real session cookie and hit every admin sidebar route plus every public route — confirmed 200s across the board, none of the earlier 500s. |
| **Tinker execution** | Directly exercised the fixed create/update logic — booking form, admin appointments, nurses, medicine store, invoices with % discounts — confirming correct writes and computed totals. |
| **Numeric cross-check** | Invoice totals computed by the new module matched the client's reference sample invoice exactly. |
| **Cleanup** | All test and seed records created during verification were deleted afterward — nothing fake left in the database. |

08 — FOR AWARENESS

## Open items & environment

### Disk space — outside the app, worth acting on

The machine's C: drive is completely full (120 GB / 120 GB used). Unrelated to this project, but it caused several tool and install failures mid-session and will cause worse problems left alone.

### Left as-is, not treated as a flaw

**Doctors admin page** — the standalone `admin_docters` route stays disabled by design; doctor records are created through Employees (position = doctor), which already works.

**Doubled route paths** — `hods` and `requestedappointments` resolve to `/admin/admin/...` due to an extra prefix in their route definitions. Cosmetic only — the app always calls them by route name, never the raw URL.
